Megapixels                    : 0.272
```

The file **ocean.jpg** was examined using the **exiftool** command to extract its metadata. The analysis revealed a **Comment field** containing the hidden message "THIS IS THE HIDDEN FLAG". This shows that sensitive information can be stored within image metadata, a form of **metadata leakage**, without affecting the visible content of the file.

2. dog.jpg

```
(hafizi@kali)~[~/Desktop/metadata_lab]
$ binwalk dog.jpg
```

DECIMAL	HEXADECIMAL	DESCRIPTION
0	0x0	JPEG image data, JFIF standard 1.01
88221	0x1589D	Zip archive data, at least v1.0 to extract, compressed size: 21, uncompressed size: 2
1, name: hidden_text.txt		
88384	0x15940	End of Zip archive, footer length: 22

```
(hafizi@kali)~[~/Desktop/metadata_lab]
$ binwalk -e dog.jpg
```

DECIMAL	HEXADECIMAL	DESCRIPTION
88221	0x1589D	Zip archive data, at least v1.0 to extract, compressed size: 21, uncompressed size: 2
1, name: hidden_text.txt		

WARNING: One or more files failed to extract: either no utility was found or it's unimplemented

```
(hafizi@kali)~[~/Desktop/metadata_lab]
$ cd _dog.jpg.extracted
ls
15890.zip hidden_text.txt
(hafizi@kali)~[~/Desktop/metadata_lab/_dog.jpg.extracted]
$ cat hidden_text.txt
THIS IS A HIDDEN FLAG
```

The file **dog.jpg** was analyzed using the binwalk tool to detect embedded data. The scan identified a hidden ZIP archive containing a file named **hidden_text.txt**. After extracting the contents using binwalk -e, the hidden file was accessed and revealed the message "THIS IS A HIDDEN FLAG". This demonstrates the concept of **file embedding**, where additional data is concealed within another file.

3. solitaire.exe

```
(hafizi@kali)~[~/Desktop/metadata_lab/_dog.jpg.extracted]
$ cd ~/Desktop/metadata_lab

(hafizi@kali)~[~/Desktop/metadata_lab]
$ ls
computer.jpg  dog.jpg  _dog.jpg.extracted  image  ocean.jpg  rubiks.jpg  solitaire.exe

(hafizi@kali)~[~/Desktop/metadata_lab]
$ file solitaire.exe
solitaire.exe: PNG image data, 640 x 449, 8-bit/color RGBA, non-interlaced

(hafizi@kali)~[~/Desktop/metadata_lab]
$ mv solitaire.exe solitaire.png

(hafizi@kali)~[~/Desktop/metadata_lab]
$ ristretto solitaire.png
```

The file **solitaire.exe** was checked using the file command to determine its actual file type. The result showed that it was not an executable, but a **PNG image (640 x 449, RGBA)**. This confirms that the file extension was misleading. After renaming it to **solitaire.png**, the file opened successfully as an image. This highlights the concept of **file extension spoofing**, where file names are manipulated to disguise their true nature.

4. rubiks.jpg

```
(hafizi@kali) - [~/Desktop/metadata_lab]
$ cd ~/Desktop/metadata_lab

(hafizi@kali) - [~/Desktop/metadata_lab]
$ ls
computer.jpg  dog.jpg  _dog.jpg.extracted  image  ocean.jpg  rubiks.jpg  solitaire.png

(hafizi@kali) - [~/Desktop/metadata_lab]
$ file rubiks.jpg
rubiks.jpg: PNG image data, 609 x 640, 8-bit/color RGBA, non-interlaced

(hafizi@kali) - [~/Desktop/metadata_lab]
$ mv rubiks.jpg rubiks.png

(hafizi@kali) - [~/Desktop/metadata_lab]
$ ristretto rubiks.png
```

The file **rubiks.jpg** was analyzed using the file command to verify its actual format. The output indicated that the file was a **PNG image (609 x 640, RGBA)** instead of a JPEG. After correcting the extension to **rubiks.png**, the image opened successfully. This is another example of **file extension spoofing**, demonstrating how attackers may disguise file types to mislead users.

5. computer.jpg

```
(hafizi@kali)~[~/Desktop/metadata_lab]
$ strings computer.jpg

```

The file **computer.jpg** was analyzed using the strings command to extract readable data from its binary content. Several meaningful strings were identified, including **"ICC_PROFILE"**, **"mntrRGB XYZ"**, and **"JFIF"**, which relate to the image's internal structure and color profile. This demonstrates how **string extraction** can reveal hidden or embedded information within binary files.

IN CONCLUSION

In conclusion, this lab highlights how various file analysis techniques can uncover hidden information that is not visible through normal inspection. Methods such as metadata extraction, embedded file detection, file signature verification, and string analysis reveal potential security risks such as metadata leakage, file embedding, and file extension spoofing. These techniques are essential in cybersecurity, as they help identify concealed data and detect suspicious or manipulated files.
